Project Handover Document

Diagnostic Management System — Web Admin Panel & Mobile App

Prepared for	**BEST Health Diagnostic Ltd**
Prepared by	**Nexovia IT**
Document date	**10 October 2026**
Version	**1.0**

This document summarises what has been delivered, how to access it, and what remains before Play Store launch.

1 Project Overview

What this project is, in plain terms.

This project gives BEST Health Diagnostic Ltd a complete digital system for managing medical examinations end-to-end: registering patients, recording medical and X-Ray results, issuing signed PDF certificates, tracking agency payments, and letting patients check their own report status online. It has two connected parts built on the same server and the same data:

Web Admin Panel

Used by office staff on a computer for day-to-day data entry, reporting and management. Already live in production.

Mobile App (Android)

A companion app for patients and staff on their phones — report lookup for patients, and the core office workflow for staff. Built and tested; not yet published to the Play Store.

2 What Has Been Delivered

Everything below is built, tested and working.

Web Admin Panel

- ✓ Patient registration with photo, passport, agency, MR and billing details
- ✓ Medical report entry (60+ fields) and X-Ray result entry
- ✓ Automatic Fit / Unfit / Held-up status, combined from the medical and X-Ray results
- ✓ Server-generated, signed PDF medical certificates
- ✓ Agency, MR (medical representative) and Country directories
- ✓ Agency balance & payment voucher tracking, with daily office statement totals
- ✓ Searchable, filterable patient database with pagination and print/export
- ✓ Role-based staff accounts, permissions, and password reset by e-mail
- ✓ Site settings (logo, e-mail sender, IT helpdesk contact) manageable from the panel

Mobile App

Patient side	Home & service info, report lookup by passport or QR scan, PDF certificate download & share, helpline callback request
Staff side	Secure login with optional fingerprint/Face unlock, dashboard, patient database & search, new patient entry, medical report & X-Ray entry, agency/MR/country directories, payment vouchers, profile & password settings, callback notifications
Security	Encrypted token storage, auto re-lock after 5 minutes idle, screenshot/screen-recording blocked in the staff area

3 Access & Links

Where everything lives.

Web Admin Panel

Live URL	https://admin.bestdiagnostic.com.bd
Login credentials	Shared separately and securely (not printed in this document). Contact Nexovia IT if a reset is needed.

Mobile App

Current build	Android APK — internal testing build (not the final Play Store release)
Download link	https://expo.dev/artifacts/eas/J-tVXZ3fGq9Tyhs7qIToJW3UDGkVbq96wLB19b42kQs.apk
Build dashboard	https://expo.dev/accounts/nexoviait/projects/best-diagnostic
Play Store status	Not yet published — see Section 5, Pending Items

> The APK installs directly on an Android phone for testing (Settings may need to allow "install from unknown sources"). It connects to the same live server as the web panel, so data entered in one shows up in the other.

4 Technology Summary

For whoever maintains this next — kept brief on purpose.

Backend	Laravel 12 (PHP 8.2), MySQL database
Web frontend	React, served from the same Laravel application
Mobile app	React Native with Expo, TypeScript — single codebase for Android & (future) iOS
Hosting	Existing VPS (Hostinger)
Certificates	Generated server-side as signed, tamper-evident PDFs

Laravel 12 · React · React Native / Expo · MySQL · TypeScript

5 Pending Items — Before Public Launch

Honest list of what is left. Nothing here is hidden or forgotten.

1. Deploy the latest backend update to the live server

The mobile app's supporting changes (new API endpoints, security limits) are built and tested locally, but still need to be deployed to the live VPS before the mobile app is fully functional for real use.

2. Real push notifications (optional upgrade)

The app currently shows callback requests while it is open. Notifications that alert staff even when the app is closed require BEST Health Diagnostic Ltd to create its own free Firebase project (a Google account is enough) — this cannot be set up on the client's behalf.

3. Google Play Store submission

Requires: a Google Play Developer account (one-time $25 fee, identity verification), a published privacy policy, store listing text and screenshots, a demo staff account for Google's reviewers, and the Play Store content/data-safety questionnaires. Typically 2–3 weeks end-to-end for a personal developer account, including Google's mandatory testing period.

4. Final production build

The current APK is a testing build. The final Play Store release (.aab format) will be built once the Play Store account and listing are ready.

5. On-device security check

The screenshot-block feature is implemented and tested in the development environment; a final confirmation on a physical Android phone is recommended once the app is installed from the link above.

6 Frequently Asked Questions

Common questions, answered in plain language.

Q Is our patients' data safe, and is it backed up?

A Yes. All data lives in a MySQL database on the VPS. Ask Nexovia IT to confirm the server's automatic backup schedule if you haven't already.

Q Can we add more staff accounts or control what each person can see?

A Yes — an Admin can create accounts and assign roles/permissions directly from the web admin panel, no developer needed.

Q What if a staff member loses their phone?

A Their saved login still needs the phone's own screen lock to open. For extra safety, an Admin can also disable that account from the panel so it stops working immediately.

Q Does the mobile app work without an internet connection?

A No. Both the patient and staff sides read and write to the central server, so an internet connection is needed at all times.

Q Can a certificate be faked or edited after it is issued?

A No. Certificates are generated and signed by the server itself, and each download link expires after a short time for added safety.

Q What will it cost to keep this running?

A Just the existing VPS hosting already in place, plus the one-time $25 Google Play fee when ready to publish. Real push notifications (Firebase) have a free tier that comfortably covers this use case.

Q Can this support iPhone users too?

A The app is already built in a way that supports iOS. Publishing it on the Apple App Store would need an Apple Developer account ($99/year) and a round of iOS-specific testing.

Q Who do we contact for support or a new feature request?

A Nexovia IT — see the contact details in Section 7.

7 Support

Who to contact once this is handed over.

Development team	Nexovia IT
Contact	nexoviait@gmail.com
Source code	Handed over in full with the project repository (web admin panel and best_mobile_app/ mobile app code)

8 Sign-off

This document confirms that the system described above has been reviewed and received.
